pledged by the government to
tackle UK cybercrime over
the next 5 years

33,000
malicious e-mails blocked at UK
government gateway each month

40%
of all reported crime is
cyber-enabled fraud

How to keep your network protected

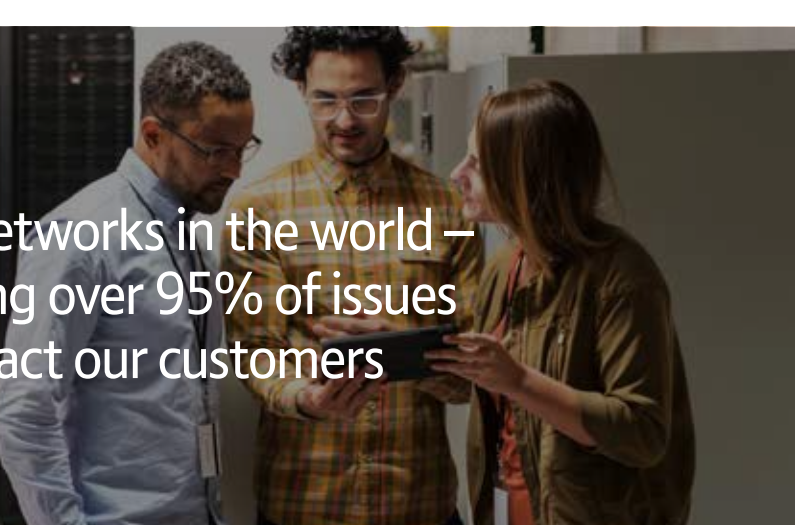

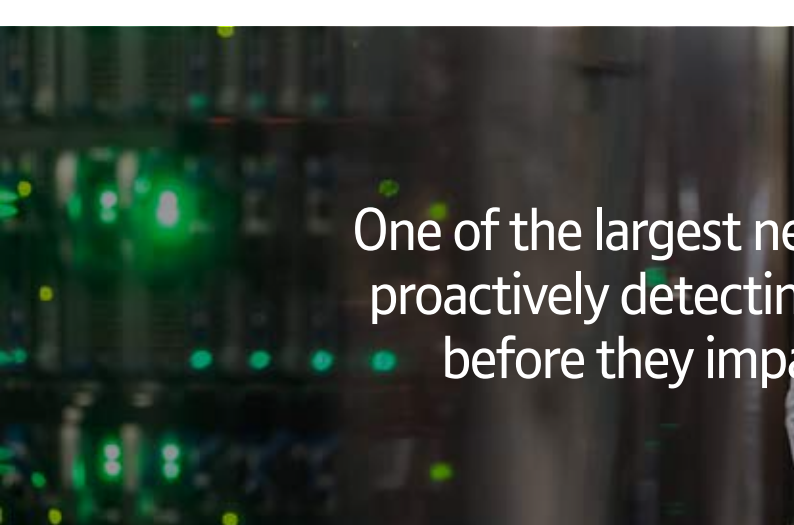

Do:

- 1 A good security audit – make sure you know which areas of your network may be vulnerable.
- 2 Defend against every kind of threat – install anti-virus software; choose the right passwords and use a VPN for secure remote access.
- 3 Protect your mobile workforce – make sure their technology is secure when working on external networks.

Don't:

- 1 Forget staff training – switched on employees are your first line of defence.
- 2 Focus on some bits but not others – you need a single, unified plan to protect your whole network.
- 3 Assume that one size fits all – identify, group and isolate critical business information assets and put the right network security controls on them.

How we can help you keep your business secure
